Project Title: Import Data using Transform Map (Spreadsheet)

Date: 28 September 2026

Team ID: SWTID-2026-2519

PHASE 6 – PROJECT TESTING

1. Introduction

The Project Testing phase verifies whether the implemented ServiceNow Import Data using Transform Map system works according to the requirements.

Spreadsheet records, field mappings, transformation rules, and target records were tested to ensure that valid data is imported correctly and invalid or incomplete data is handled appropriately.

2. Testing Objectives

• To verify spreadsheet upload.

• To verify Import Set creation.

• To verify source-to-target field mapping.

• To verify Transform Map execution.

• To verify valid record insertion.

• To verify mandatory field validation.

• To verify invalid data handling.

• To ensure the import process works correctly.

3. Test Environment

• ServiceNow instance

• Spreadsheet / Excel source file

• Import Set table

• Transform Map

• Target table

• Sample institution records

• Administrator account

• Test user account

4. Test Cases

Test ID	Test Scenario	Expected Result	Result
TC01	Valid spreadsheet uploaded	File uploaded successfully	Pass
TC02	Spreadsheet data imported	Import Set records created	Pass
TC03	Transform Map executed	Records transformed successfully	Pass
TC04	Name field mapped	Target Name populated	Pass
TC05	Branch field mapped	Target Branch populated	Pass
TC06	Department field mapped	Target Department populated	Pass
TC07	Mandatory field missing	Invalid record identified	Pass
TC08	Valid record transformed	Record inserted into target	Pass
TC09	Invalid data format	Record rejected/flagged	Pass
TC10	Target records verified	Data matches expected values	Pass

5. Spreadsheet Import Testing

Test 1 – Valid Spreadsheet Upload

A valid spreadsheet containing the required source fields was uploaded into the ServiceNow import process.

Expected Result: The spreadsheet should be accepted and imported. Result: Pass

Test 2 – Import Set Creation

The uploaded spreadsheet data was checked in the Import Set table.

Expected Result: Source rows should be created as Import Set records. Result: Pass

Test 3 – Transform Map Execution

The configured Transform Map was executed to transfer source data into the target table.

Expected Result: Imported rows should be transformed successfully. Result: Pass

Test 4 – Field Mapping

Source spreadsheet fields were mapped to their corresponding target-table fields.

• Name: Mapped correctly

• Branch: Mapped correctly

• Department: Mapped correctly

Expected Result: Target fields contain the correct source values. Result: Pass

Test 5 – Mandatory Field Validation

A test record with a missing mandatory value was processed.

Expected Result: The invalid record should be identified and should not create an incorrect target record. Result: Pass

6. Data Transformation Testing

The Transform Map was tested to verify that source spreadsheet values are transferred and transformed correctly into the target table.

Test – Name Field

The Name value from the spreadsheet was mapped to the corresponding target field.

Expected Result: Data should be transferred correctly according to the configured transformation rules.
Result: Pass

Test – Branch Field

The Branch value from the spreadsheet was mapped to the target Branch field.

Expected Result: Data should be transferred correctly according to the configured transformation rules.
Result: Pass

Test – Department Field

The Department value from the spreadsheet was mapped to the target Department field.

Expected Result: Data should be transferred correctly according to the configured transformation rules.
Result: Pass

Test – Invalid Data

A record containing invalid or incomplete source information was processed.

Expected Result: Data should be transferred correctly according to the configured transformation rules.
Result: Pass

7. Import Result Testing

After the Transform Map completed, the target table was checked to confirm that the expected records were created.

• Valid source records were transferred.

• Mapped fields contained expected values.

• Mandatory field rules were respected.

• Invalid records were identified.

• Transformation results matched the configured mapping.

8. Error Handling Testing

• Missing mandatory source values were checked.

• Invalid data formats were checked.

• Incorrect field mappings were checked.

• Unmapped source fields were reviewed.

• Failed transformation records were identified.

9. Security and Access Testing

• Only authorized users were allowed to perform the import operation.

• Import and transformation configuration was checked for proper access.

• Target records were reviewed after transformation.

• Unauthorized users were restricted from configuration activities.

10. Data Verification

The transformed records in the target table were compared with the original spreadsheet data.

Expected Result: The target data should accurately represent the source data after applying the configured Transform Map rules.

Result: Pass

11. Test Summary

Area Tested	Status
Spreadsheet Upload	Pass
Import Set Creation	Pass
Transform Map Execution	Pass
Field Mapping	Pass
Mandatory Field Validation	Pass
Data Transformation	Pass
Error Handling	Pass
Target Data Verification	Pass
Access Control	Pass

12. Testing Outcome

The testing confirmed that spreadsheet data can be imported into ServiceNow and processed through the configured Transform Map. The source fields were mapped to the target fields, valid records were transformed successfully, and invalid or incomplete data was identified according to the configured rules.

13. Conclusion

The Project Testing phase verified the functionality of the Import Data using Transform Map (Spreadsheet) process. The test cases demonstrated that spreadsheet records can be uploaded, transformed, mapped, and inserted into the target table correctly. The testing also verified data validation, error handling, and access control.
