Project Title: Import Data using Transform Maps (Spreadsheet)

Date: 28 September 2026

Team ID: SWTID-2026-2519

PHASE 1 – BRAINSTORMING & IDEATION

1. Problem Statement:

In an organization, large amounts of student and institutional information may need to be entered into ServiceNow. Manually entering every record can take more time and may lead to data-entry errors.

The project aims to import spreadsheet data into ServiceNow efficiently by using Transform Maps. Spreadsheet data will be uploaded, mapped to the required fields, and transformed into records in a target table.

2. Existing Problem:

1. Entering large numbers of records manually takes more time.
2. Manual data entry may cause typing and formatting errors.
3. Spreadsheet columns may not directly match ServiceNow table fields.
4. Repeated data entry can reduce productivity.
5. Managing large datasets manually can become difficult.
6. Incorrect mapping may create inconsistent data.

Therefore, a proper spreadsheet import and transformation mechanism is required.

3. Proposed Solution:

The proposed solution is to import spreadsheet data into ServiceNow using Import Sets and Transform Maps.

The system will:

1. Create a target custom table for storing required information.
2. Prepare student/institution data in a spreadsheet.
3. Upload the spreadsheet data into ServiceNow.
4. Create an Import Set Table to receive the imported data.
5. Create a Transform Map between the Import Set Table and target table.
6. Map spreadsheet columns to the appropriate target fields.
7. Use field mapping and transformation rules to process the data.
8. Import and verify the final records in the target table.

4. Main Idea:

The main idea of the project is:

“Import spreadsheet data into ServiceNow accurately and efficiently using Transform Maps.”

Spreadsheet → Import Set → Transform Map → Field Mapping/Transformation → Target Table → Imported Records

5. Objectives:

1. To understand ServiceNow Import Sets and Transform Maps.
2. To prepare spreadsheet data for importing.
3. To create an Import Set Table for source data.
4. To create a Transform Map between source and target tables.
5. To map spreadsheet columns with ServiceNow target fields.
6. To use transformation rules when required.
7. To reduce manual data-entry work.
8. To improve the accuracy and consistency of imported records.
9. To test and verify the imported data in the target table.

6. Proposed Features:

Feature	Description
Spreadsheet Import	Imports source data from a spreadsheet
Import Set Table	Temporarily stores imported source records
Transform Map	Maps source fields to target fields
Field Mapping	Connects spreadsheet columns with ServiceNow fields
Transformation	Processes or modifies values during import
Target Table	Stores the final imported records
Data Validation	Helps verify imported records
Import Verification	Checks the final result after transformation

7. Expected Outcome:

1. Spreadsheet data will be successfully imported into ServiceNow.
2. Source columns will be mapped to the correct target fields.
3. Transformation rules will process data where required.
4. Imported records will be available in the target table.
5. Manual data-entry effort will be reduced.
6. The project will demonstrate how Import Sets and Transform Maps can be used for efficient data migration.

8. Conclusion:

The brainstorming phase identified the need for a simple and efficient method to move spreadsheet data into ServiceNow. The proposed Import Data using Transform Maps solution addresses manual data-entry and field-mapping requirements by using Import Sets, Transform Maps, field mapping, and transformation rules.

This idea will be developed further in the next phases, including Requirement Analysis, Project Design, Planning, Development, Testing, Documentation, and Demonstration.
