Project Title: Import Data using Transform Maps (Spreadsheet)

Date: 28 September 2026

Team ID: SWTID-2026-2519

PHASE 7 – PROJECT DOCUMENTATION

1. Introduction:

This project demonstrates how spreadsheet data can be imported into ServiceNow using Import Sets and Transform Maps. The system takes structured data from a spreadsheet, loads it into a staging table, maps the source fields to target table fields, and transforms the data into ServiceNow records.

2. Problem Statement:

Organizations often maintain student, employee, customer, or institutional information in spreadsheets. Manually entering large amounts of spreadsheet data into ServiceNow is time-consuming and can lead to data-entry errors. This project addresses the problem by using Import Sets and Transform Maps to move spreadsheet data into a ServiceNow target table in a controlled and repeatable way.

3. Project Objectives:

■ To import spreadsheet data into ServiceNow.

■ To use Import Sets for staging imported records.

■ To create a Transform Map between source and target tables.

■ To map spreadsheet columns to ServiceNow fields.

■ To transform and load records into the target table.

■ To reduce manual data-entry work.

■ To improve consistency and accuracy of imported data.

■ To verify the imported records after transformation.

4. Technologies and Tools:

Tool	Purpose
ServiceNow	Project implementation and data import
Import Sets	Staging imported spreadsheet data
Transform Maps	Mapping and transforming source data
Spreadsheet (CSV/XLSX)	Source data for import
Web Browser	Accessing ServiceNow
GitHub	Project repository and submission
Google Drive	Demonstration video

5. System Design:

Spreadsheet → Import Set → Import Set Table → Transform Map → Target Table → Imported Records

The spreadsheet contains the source records. ServiceNow imports the file into an Import Set staging table. The Transform Map connects source fields with the corresponding fields in the target table. After transformation, the records are created or updated in the target table.

6. Source Spreadsheet Design:

Field	Example
Student Roll Number	STU001
Student Name	Arun Kumar
Faculty Name	Ravi
Branch	CSE
Email	arun@example.com
Phone Number	9876543210
Description	Student information

7. Target Table Design:

Institution Details

Table Name: u_institution_details

Field	Type
Student Roll Number	Auto Number / String
Student Name	Reference – User
Faculty Name	Reference – User
Branch	Choice
Email	String
Phone Number	String
Description	Multi String

Branch Values:

■ EEE

■ ECE

■ CSE

8. Transform Map Design:

The Transform Map is created to connect the imported spreadsheet fields with the fields in the Institution Details target table.

Source Field	Target Field
Student Roll Number	Student Roll Number
Student Name	Student Name
Faculty Name	Faculty Name
Branch	Branch
Email	Email
Phone Number	Phone Number
Description	Description

The field mappings determine where each spreadsheet value is stored in the target table. Appropriate field mapping helps ensure that imported data reaches the correct ServiceNow fields.

9. Import and Transform Implementation:

Step 1 – Prepare Spreadsheet: Create the spreadsheet with column headings and records in a structured format.

Step 2 – Create Import Set: In ServiceNow, open the Import Set process and upload the spreadsheet file.

Step 3 – Load Data: ServiceNow loads the spreadsheet records into a temporary Import Set table.

Step 4 – Create Transform Map: Create a Transform Map and select the Import Set table as the source and Institution Details as the target.

Step 5 – Field Mapping: Map each source spreadsheet column to the corresponding target field.

Step 6 – Run Transform: Execute the transformation to transfer the source records into the target table.

Step 7 – Verify Records: Open the Institution Details table and verify that the imported records are available.

10. Transform Map Field Mapping:

Source	Target	Purpose
Student Roll Number	Student Roll Number	Identifies the student
Student Name	Student Name	Stores student name
Faculty Name	Faculty Name	Stores faculty information
Branch	Branch	Stores branch value
Email	Email	Stores email address
Phone Number	Phone Number	Stores phone number
Description	Description	Stores additional information

11. System Workflow:

1. User prepares the spreadsheet with valid records.
2. User opens the Import Set process in ServiceNow.
3. Spreadsheet file is uploaded.
4. ServiceNow loads the source data into the Import Set table.
5. Transform Map is selected or created.
6. Source fields are mapped to target fields.
7. Transform process is executed.
8. Records are inserted or updated in the target table.
9. User verifies the imported records.

12. Testing:

Testing was performed using different spreadsheet records and checking the transformed output in the target table.

Test Area	Expected Behavior
Valid spreadsheet	Data loads successfully
Correct field mapping	Values appear in the correct target fields
Multiple records	All valid records are transformed
Branch field	Branch value is imported correctly
Email and Phone	Contact details are stored correctly
Empty/invalid data	Record is handled according to import/transform configuration
After transform	Records are visible in Institution Details

13. Project Outcome:

The project demonstrates how ServiceNow Import Sets and Transform Maps can be used to import spreadsheet data into a target table.

The implementation provides:

■ Spreadsheet-based data import.

■ Staging through Import Sets.

■ Field mapping using Transform Maps.

■ Automated transfer of records to the target table.

■ Reduced manual data-entry effort.

■ Better consistency of imported information.

14. Benefits:

1. Faster Data Import – Large amounts of spreadsheet data can be loaded efficiently.

2. Reduced Manual Work – Minimizes repeated manual record creation.

3. Improved Accuracy – Field mapping reduces data-entry mistakes.

4. Reusable Process – Transform Maps can be reused for similar imports.

5. Controlled Transformation – Source data can be mapped and transformed before reaching the target table.

6. Better Data Management – Imported records are stored in a structured ServiceNow table.

15. Limitations:

■ Spreadsheet data must follow the expected column structure.

■ Incorrect field mapping can place data in the wrong target fields.

■ Invalid or incomplete source values may require data cleaning.

■ Large or complex imports may require additional transformation logic.

16. Future Enhancements:

■ Add scheduled or automated spreadsheet imports.

■ Add validation rules for source data before transformation.

■ Use transform scripts for advanced data conversion.

■ Add error reporting and import monitoring.

■ Create dashboards to monitor import success and failure.

■ Extend the solution to additional ServiceNow tables.

17. Conclusion:

The Import Data using Transform Maps (Spreadsheet) project demonstrates a practical method for moving spreadsheet information into ServiceNow. By combining Import Sets, Transform Maps, field mapping, and the target table, the system can convert source spreadsheet records into structured ServiceNow records.

The project provides a practical example of how ServiceNow data-import features can reduce manual work, improve consistency, and support controlled data migration.
