PHASE 8 – PROJECT DEMONSTRATION

Project Title: Import Data using Transform Maps (Spreadsheet) in ServiceNow

Date: 28 September 2026

Team ID: SWTID-2026-2519

1. Introduction

The Project Demonstration phase presents the completed ServiceNow project and explains the purpose, implementation, working process, and final output.

This demonstration shows how data from a spreadsheet is imported into ServiceNow using Import Sets and Transform Maps. The spreadsheet data is first loaded into a staging table and then transformed into the target table using field mapping.

2. Project Purpose

The purpose of this project is to import institutional student records from a spreadsheet into the ServiceNow **Institution Details** table.

• Spreadsheet data can be loaded into ServiceNow.

• Imported data is stored temporarily in a staging table.

• Source fields are mapped to target-table fields.

• Data is transformed correctly into the Institution Details table.

• Duplicate records can be controlled using coalesce fields.

• Imported records can be verified after transformation.

3. Project Benefits

• Faster data entry.

• Reduced manual work.

• Accurate field mapping.

• Easy bulk data import.

• Better data consistency.

• Reduced data-entry errors.

• Reusable Transform Map configuration.

• Efficient migration of spreadsheet data into ServiceNow.

4. Demonstration Requirements

• Student introduction.

• Project name and purpose.

• Project benefits.

• ServiceNow environment.

• Spreadsheet file and sample data.

• Institution Details target table.

• Import Sets module and staging table.

• Transform Map and field mapping.

• Coalesce configuration.

• Transformation process.

• Imported records.

• Testing and final output.

5. Demonstration Procedure

Step 1 – Introduction

"Hello, I am Uma. My project title is Import Data using Transform Maps (Spreadsheet) in ServiceNow. This project demonstrates how spreadsheet data can be imported into a ServiceNow table using Import Sets and Transform Maps."

Step 2 – Explain the Purpose

"The main purpose of this project is to import student and institutional information from a spreadsheet into the Institution Details table. The spreadsheet data is loaded into a staging table, mapped to the target table, and transformed into ServiceNow records."

Step 3 – Open ServiceNow

Show the ServiceNow development environment and explain: "This is my ServiceNow development environment. I have implemented the complete spreadsheet import process in this instance."

Step 4 – Show the Spreadsheet

Display the spreadsheet used for importing data. Show the columns below:

Student Roll Numb	rStudent Name	Faculty Name	Branch	Email	Phone Number
101	Arun	Engineering	EEE	arun@example.com	9876543210
102	Divya	Engineering	ECE	divya@example.com	9876543211
103	Kavin	Engineering	CSE	kavin@example.com	9876543212

"This spreadsheet contains sample student and institutional information. Each spreadsheet column will be mapped to the corresponding field in the Institution Details table."

Step 5 – Show the Institution Details Table

Show the target-table fields: Student Roll Number, Student Name, Faculty Name, Branch, Email, Phone Number, and Description.

"This is the target table where the spreadsheet data will be stored after the transformation process is completed."

Step 6 – Open Load Data

Navigate to **System Import Sets → Load Data**. Upload the spreadsheet file, select the Excel or CSV file type, choose the sheet number, and specify the header row.

> "I am loading the spreadsheet using the Load Data module. ServiceNow reads the spreadsheet and stores the imported rows in a temporary staging table."

Step 7 – Show the Staging Table

> "The staging table temporarily stores the spreadsheet data. This table is used as the source for the Transform Map."

6. Create the Transform Map

Step 8 – Create Transform Map

Field	Value
Name	Institution Details Spreadsheet Transform
Source table	Generated import set table
Target table	Institution Details
Active	Yes

> "The Transform Map defines the relationship between the staging table and the Institution Details target table. It controls how each source field is transferred to the target field."

Step 9 – Configure Field Mapping

Source Field	Target Field
Student Roll Number	Student Roll Number
Student Name	Student Name
Faculty Name	Faculty Name
Branch	Branch
Email	Email
Phone Number	Phone Number
Description	Description

> "The source fields from the staging table are mapped to the corresponding fields in the Institution Details table. This ensures that every value is stored in the correct target field."

Step 10 – Configure Coalesce

Set **Student Roll Number** as the coalesce field.

> "I have selected Student Roll Number as the coalesce field. This helps ServiceNow identify existing records and prevents duplicate records during future imports."

7. Run the Transformation

Step 11 – Start the Transform

Open the Transform Map, click the Transform related link, select the required import set and Transform Map, and click Transform.

> "The Transform operation takes data from the staging table, applies the field mappings, and inserts or updates records in the Institution Details table."

Step 12 – Show Transform Results

> Display the number of records processed, inserted, updated, rejected, or ignored. Explain: "The transformation has completed successfully. The result shows how many spreadsheet records were processed and added to the target table."

8. Access the Imported Records

Open the Institution Details list and show the imported EEE, ECE, and CSE records.

> "The spreadsheet records are now available in the Institution Details table. The imported values are correctly displayed in their corresponding fields."

9. Testing Demonstration

Test 1 – Successful Import: Show that all valid spreadsheet records are available in the Institution Details table.

Test 2 – Field Mapping Verification: Compare one imported record with the original spreadsheet row and confirm that the values match.

Test 3 – Duplicate Prevention: Import the same spreadsheet again or use an existing Student Roll Number. Explain that the coalesce field identifies the existing record instead of creating a duplicate.

Test 4 – Invalid Data: Show a row with missing or incorrect data, if available, and explain that it can be corrected before importing again.

10. Project Workflow

Spreadsheet File → Load Data → Staging Table → Create Transform Map → Map Fields → Apply Coalesce → Run Transform → Institution Details Table → Verify Records

> "The spreadsheet is first loaded into a staging table. The Transform Map then maps the source fields to the target fields. After the transformation is executed, the final records are stored in the Institution Details table."

11. GitHub Repository

Show the GitHub repository containing the project documentation.

Repository: import-data-transform-map-servicenow

- Spreadsheet file.
- Screenshots.
- Transform Map configuration.
- Field mapping details.

• Testing results.

• Project documentation.

• Demonstration video details.

12. Demonstration Video

• Upload the video to Google Drive.

• Open the video's Share option.

• Change General Access to Anyone with the link.

• Set permission to Viewer.

• Copy the link.

• Add the link to the required SkillWallet project submission.

13. Final Output

> "The final output demonstrates that spreadsheet data has been successfully imported into ServiceNow using Import Sets and Transform Maps. The source fields were mapped correctly, the data was transformed successfully, and the final records are available in the Institution Details table."

14. Final Conclusion

The project demonstrates the complete process of importing spreadsheet data into ServiceNow using Transform Maps. It shows how a spreadsheet can be loaded into a staging table, mapped to a target table, transformed, and verified. The project improves data-entry efficiency, reduces manual errors, and provides a reliable method for bulk data import.
